Double Deep Racking System

Description:

The Double Deep Racking System is designed to increase storage capacity by storing two pallets deep per rack level instead of one. It optimizes space utilization while maintaining an efficient balance between selectivity and density. This system is ideal for warehouses that store multiple pallets of the same SKU and want to reduce aisle space.

Features:

*Stores two pallets deep for higher storage density.
Reduces the number of aisles required.
Increases storage capacity by up to 30% compared to selective racks.
Requires a specialized double-reach forklift for pallet handling.
Cost-effective solution for medium- to high-turnover inventory.*

Applications:

Perfect for distribution centers and warehouses that handle uniform products in bulk, such as FMCG, food, and manufacturing industries.
